- AYESHA QAZI (21ABELT0895)

TABLE OF CONTENTS

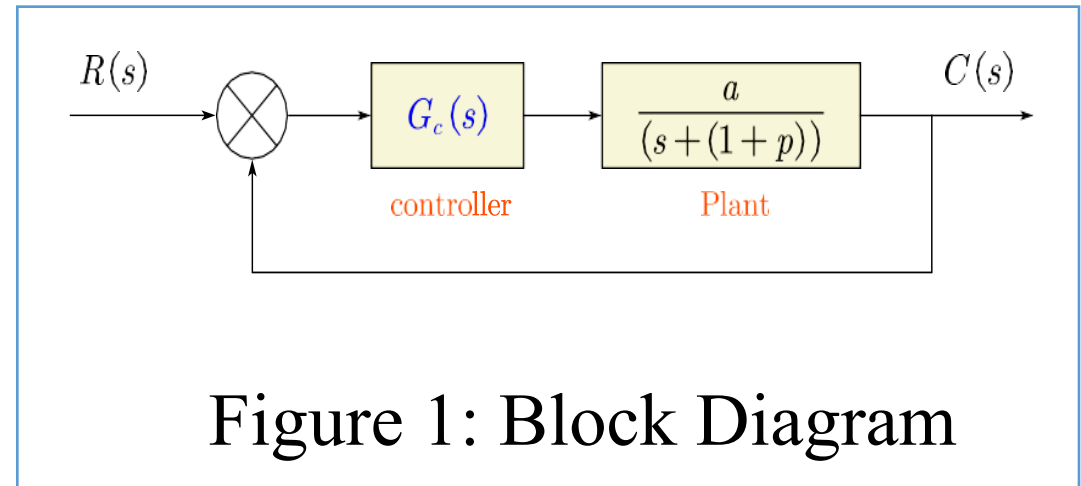

- Design statement
- Setting transfer function ($G(s)$) parameters
- Open loop bode plot for $G(s)$
- Open loop step response for $G(s)$
- Technique for controller design
- Required parameters calculation
- Controller design using SISIO tool
- Close loop bode plot of $T(s)$
- Step response of $T(s)$

Design Statement

Design a controller for a position-control system represented by the block diagram in figure 1.

The transfer function of the plant has been mathematically modelled, and can be expressed as:

- $G(s) = a/(s+1+p)$
- For $0 < a < 10$ and $0 < p < 1$

Design Requirement

- The compensated system should have the step response that settle inside the following envelope of : $1 \pm e^{(-2t)}$

- a) Steady State value=1
- b) % Overshoot <15%
- c) Settling Time <1sec
- d) Peak Value <1.5
- e) Peak Time < 0.5
- f) steady-State error=0

Setting Transfer Function Parameters

- The following values are chosen:
 - $a=5$
 - $p=0.5$
- Now the transfer function is:
$$G(s) = 5/(s+1.5)$$
- The system is first order and type zero.

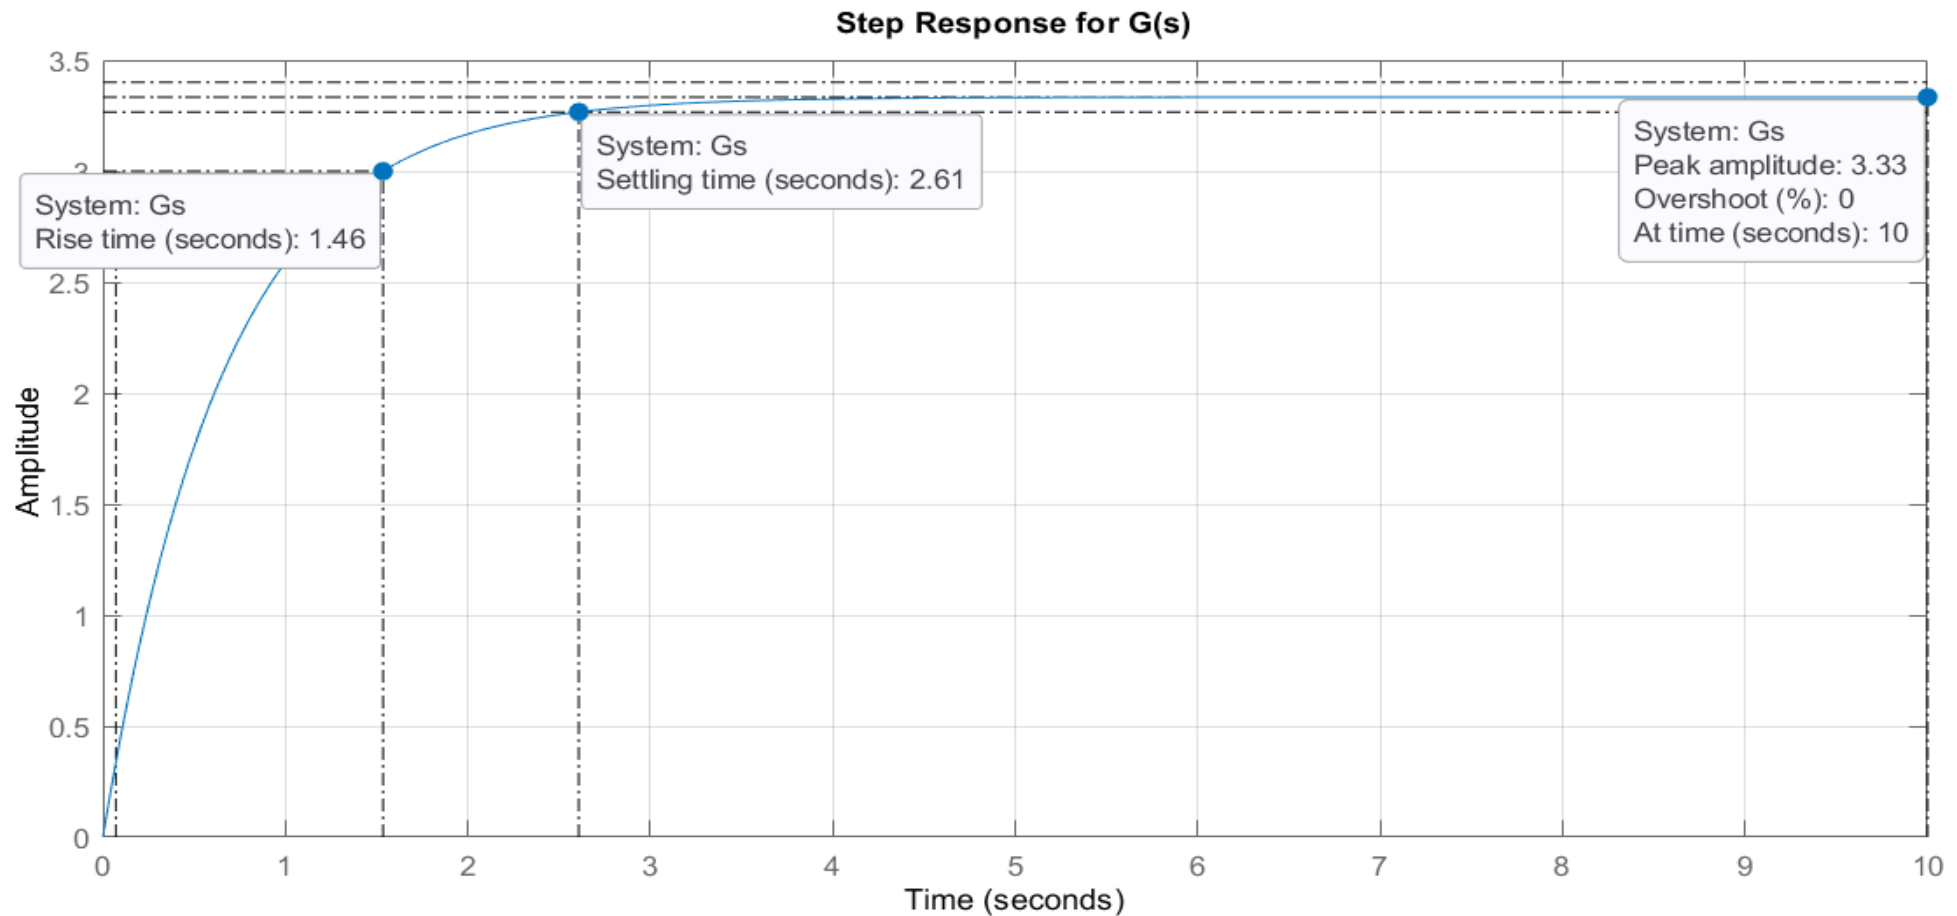

Open Loop Bode Plot

- MATLAB Code:

```
a=5;p=0.5;  
k=0.3;  
t=0:0.001:10;  
s=tf('s');  
Gs=(a*k)/(s+1+p)  
bode(Gs)  
grid on
```

Step Response of $G(s)$

Controller Selection

- PI controller is used in order to meet the requirements
- PI controller adds a pole at origin and a zero
- PI controller can address the steady-state error and improve the settling time while maintaining stability.

Controller Parameters Calculation

- **Using MATLAB:**

pos=15

Ts=0.2

$$\text{zeta} = (-\log(\text{pos}/100)) / (\sqrt{\pi^2 + \log(\text{pos}/100)^2})$$

$$\text{Pm} = \text{atan}(2 * \text{zeta} / (\sqrt{-2 * \text{zeta}^2 + \sqrt{1 + 4 * \text{zeta}^4}})) * (180 / \pi)$$

$$\text{Wbw} = (4 / (\text{Ts} * \text{zeta})) * \sqrt{(1 - 2 * \text{zeta}^2) + \sqrt{4 * \text{zeta}^4 - 4 * \text{zeta}^2 + 2}}$$

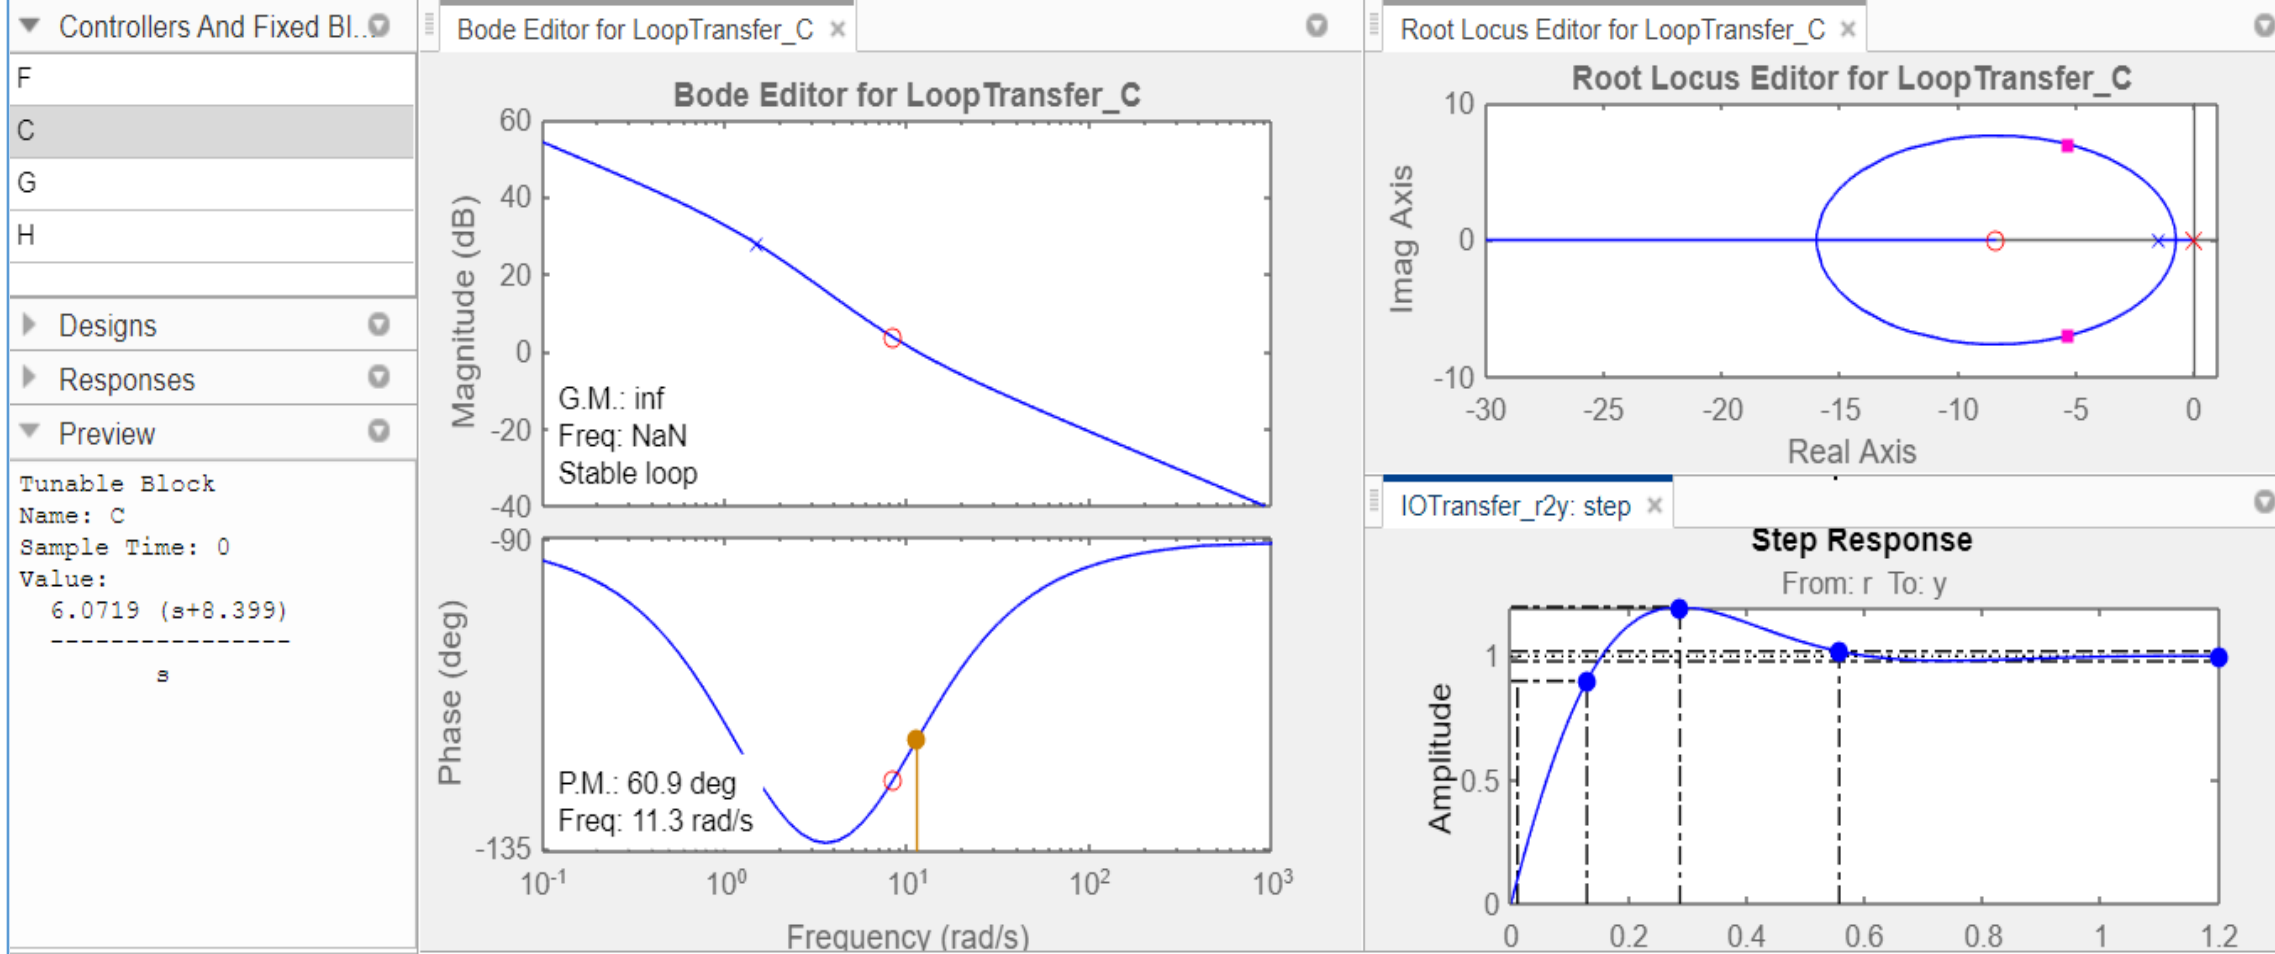

- **Results:**

zeta = 0.5969

Pm = 59.1718

Wbw = 48.4571

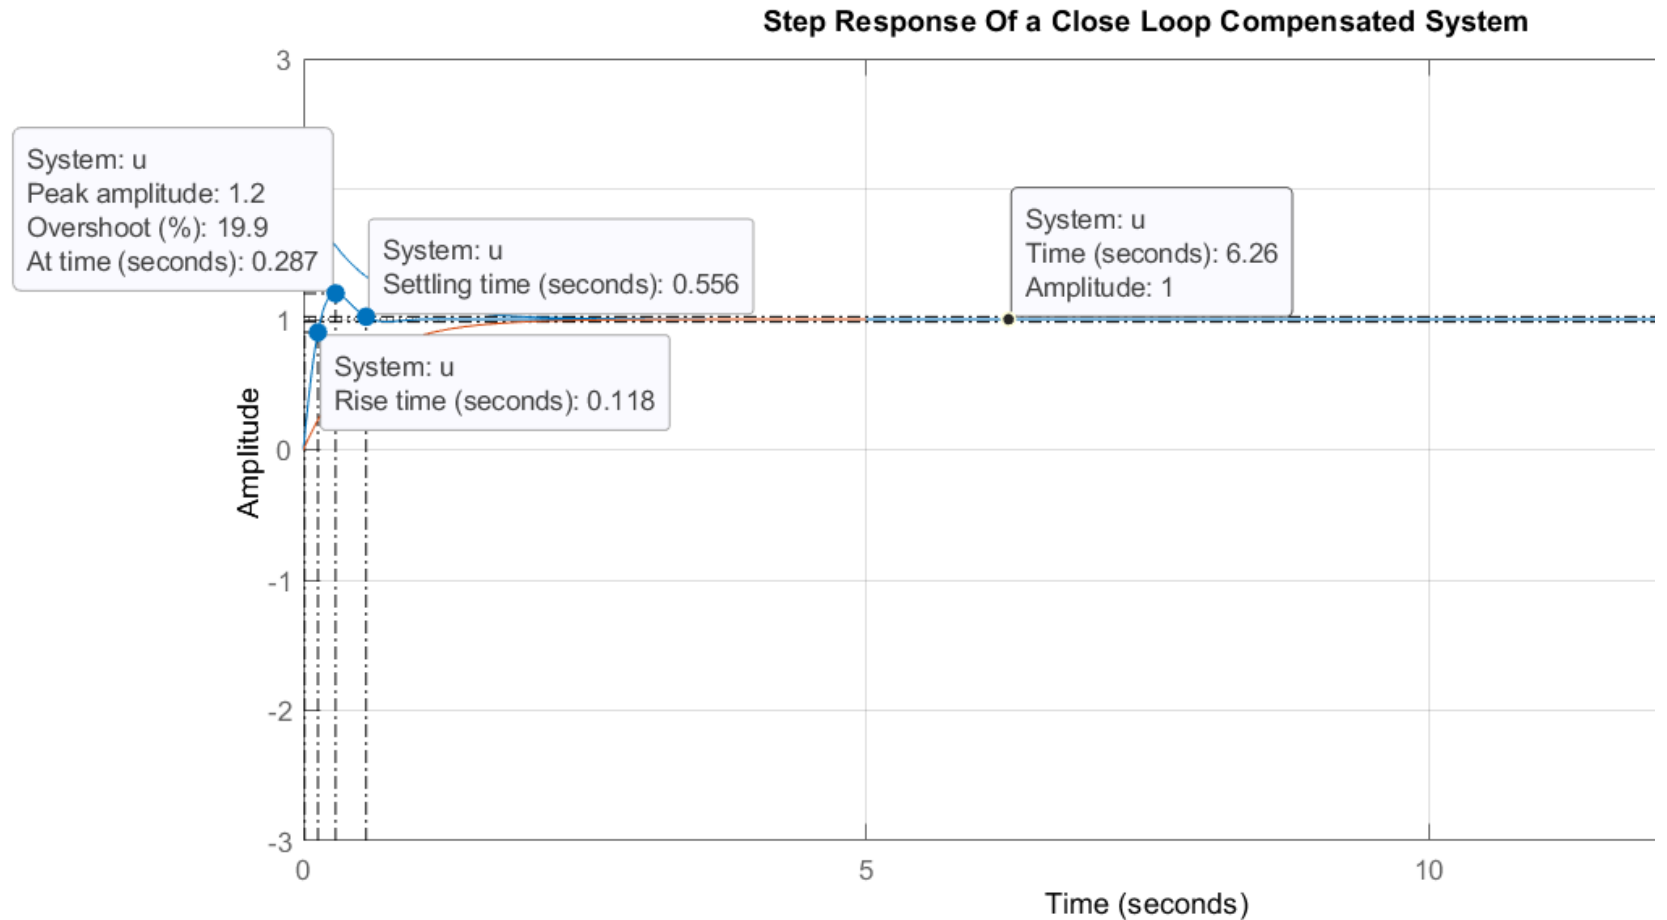

PI Controller Tuning SISO Tool

Step Response of Close Loop Compensated System

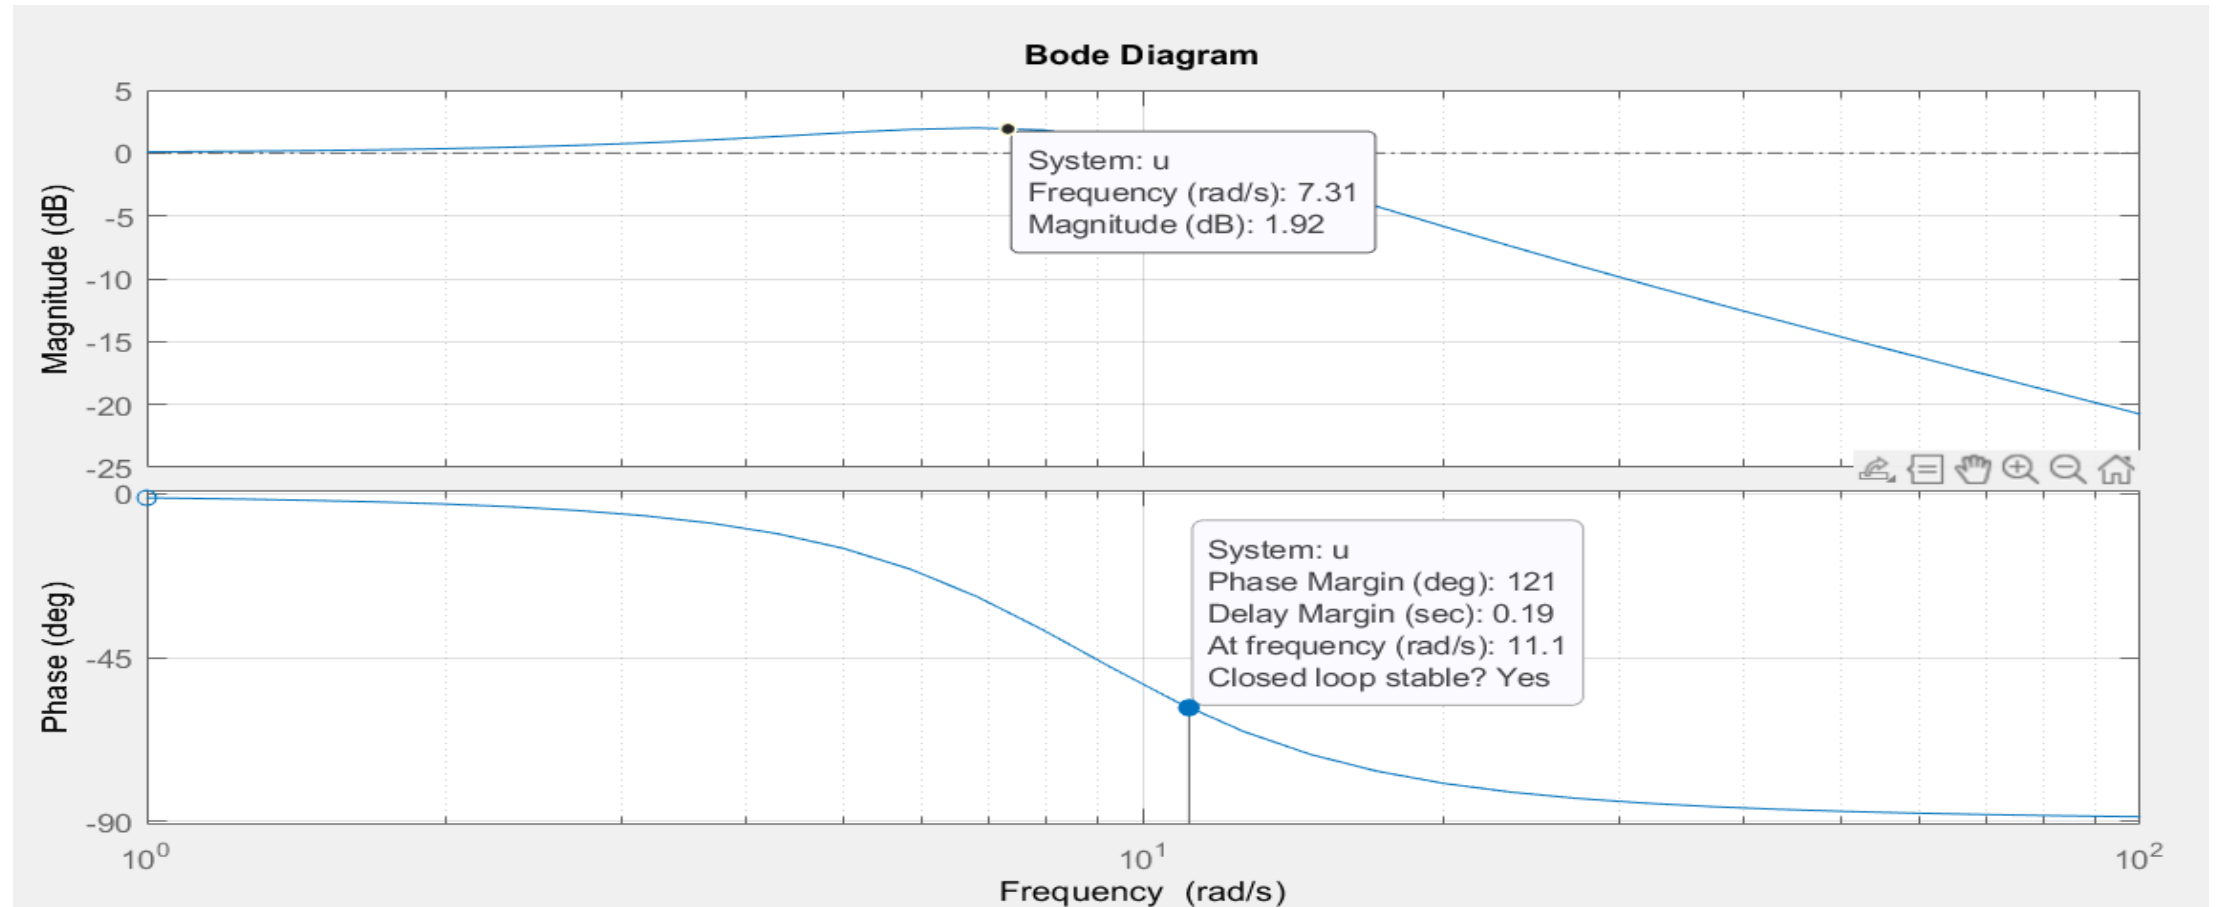

Step Response

```
t=0:0.01:5;  
s=tf('s');  
u=feedback(G*C,1);  
step(u)  
hold on  
e=1+exp(-2*t);  
plot(t,e)  
hold on  
d=1-exp(-2*t);  
plot(t,d)  
axis([0 15 -3 3])
```

Close Loop Frequency Response

```
u=feedback(G*C,1);bode(u)
```

The image features a light blue background with a thin blue rectangular border. At each of the four corners, there is a larger, darker blue geometric shape that fits into the corner of the page, creating a layered, frame-like effect.

Thankyou
